Dear Dr Murphy,

Your manuscript "Testing the wind disruption and disturbance refugia hypothesis for mountain pine beetle outbreaks (*Dendroctonus ponderosae*) Terrain, stand density and flight-period wind as controls on attack in the Selkirk Mountains of British Columbia" has now been assessed.

Because your manuscript was not given a high priority rating during the initial screening process, we have decided not to proceed it through external peer review.

It is our policy to decline a substantial proportion of manuscripts without sending them to referees so that they may be sent elsewhere without further delay. Your paper addresses an interesting topic and the study has been apparently well carried out. However, we are concerned that your manuscript will appeal to only a small subset of Journal of Pest Science readership and that it does not contain sufficiently novel knowledge for our broad audience.

We are sorry that we cannot respond more positively and more promptly on this occasion but hope that you will receive a more favorable response elsewhere soon, and we hope you will consider Journal of Pest Science as an outlet for your future works.

Yours sincerely

The Journal of Pest Science Editorial Office
